Evolving from Lafert to Lafert

Endless integrated solutions

Since inception we have overseen strategic positions and evolved together with the markets. We have led the way in the world of energy efficiency and environmental sustainability. We have always been, and still are, the market leader of product customisation.

“From Lafert to Lafert” represents the evolution that confirms the desire to progress in the wake of our company history which has always resulted in absolute quality.

Now we target an innovative but solid route to give you just what you need, with the flexibility of integrated solutions. This means better understanding the needs of a continually changing market and consequently building a clear path for the future.

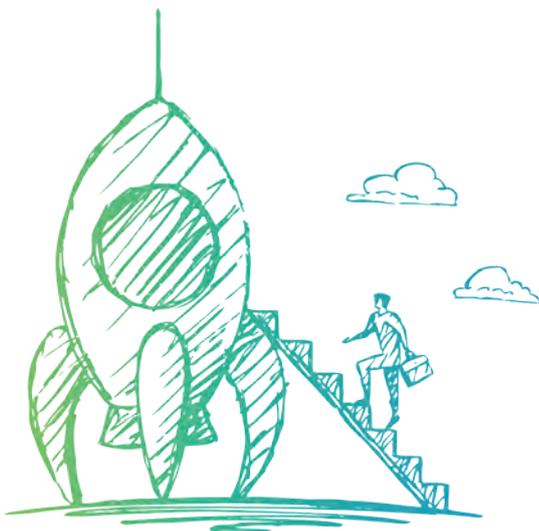

For these reasons we are member of the large international industry group Sumitomo Drive Technologies.

Evolving from Lafert to Lafert

Our watchword is "evolution", because we face new challenges every day with a clear vision for constant improvement.

Through company choices, inhouse skills and market demands, we have always been committed to technological innovation that matures over time.

Lafert Group, with 60 years of experience and our partnerships with international players, represents innovation that evolves, does not stop, and continues to adapt "**endless integrated solutions**".

Whatever we do we think big

We are European leaders in the designing and manufacturing of customized electric motors and drives used primarily in the fields of industrial automation, energy saving and renewables.

Each individual company of our group contributes to the success of the organization through their specialized strength in design and production. The combined knowledge of the organization supports the continuous research and development of innovative technologies.

It is a great responsibility that we assume for the world and future generations, an awareness that allows us to understand the future, to think big, and to anticipate the next global needs to **achieve a more efficient and sustainable world**.

The key is technological development

Evolution requires technological development, testing ourselves with global challenges and striving to achieve new energy standards. Since our establishment, we have constantly valued research and development. Thanks to our flexible design and production capabilities, we are able to quickly respond to the global market with new ideas.

The endless future applications of our products ensure that Lafert Group will always evolve and adapt with time. This can be demonstrated by the introduction of permanent magnet technologies, the creation of highly efficient IE4 and IE5 products and the integration between electromechanical technologies.

Our focus on technological innovation is the key to achieving **greater efficiency performance in variable speeds, maximum energy savings and a compact design.**

Our global presence

We offer the highest flexibility in design and operate across **thirteen locations in Europe, North America, Asia and Australia.** Our 6 production units work closely to coordinate the integration of production processes. This allows us to offer customized technological solutions to meet market demands.

Since 2018 we have been member of the large international group **Sumitomo**. Thanks to the ambitious investment plan, organizational strengthening, and complementary internal production capabilities, many business opportunities have already developed and will continue to grow in the near future.

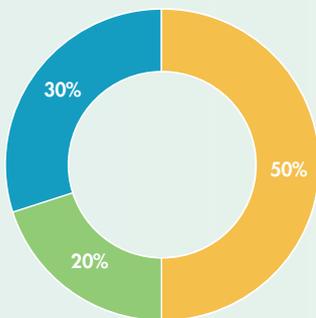

We have created a powerful claim, a statement that sets a long-term goal and represents the ideal to which we aim to.

Shaping the future together

GENERAL INFORMATION

QUALITY SYSTEM CERTIFICATE

The strictness of our quality control assures the flawless operation and reliability of our products. Our quality is confirmed by the **Certificate ISO 9001:2015** awarded by CERMET, a certification body authorized by ACCREDIA.

SAFETY STANDARDS

Our motors comply with the requirements of the International Standard **IEC 60034** for rotating electrical machines as well as with the following European Directives: **Low Voltage Directive (LV) 2014/35/EC**, **Electromagnetic Compatibility Directive (EMC) 2014/30/EC** and **RoHS Directive 2011/65/EC** on the restriction of hazardous substances in electrical and electronic equipment.

All products comply with the requirements of the **Directive Machines (MD) 2006/42/EC**. In accordance with this Directive, induction motors are components and intended solely for integration into other machines. Commissioning is forbidden until conformity of the end-product with this Directive is proved.

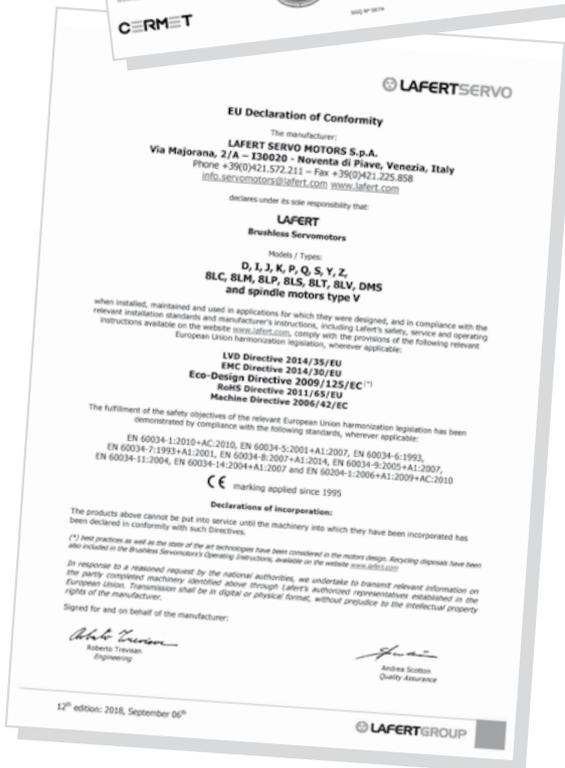

The CE marking was applied for the first time in 1995.

When operating the motor, the observance of the Regulation EN 60204-1 and safety instructions indicated in our Operating Instructions must be complied with.

Motors complied with all applicable UK legislative requirements (UK Conformity Assessed).

STANDARDS AND REGULATIONS

Furthermore all servomotors can be manufactured according to the following standard:

UL 1004 - Electric Motors and CSA C22.2 No 100 - Motors and Generators

So the mark cURus applies to the whole series.

Explosive Atmospheres Directive (ATEX) 2014/34/EU, concerning equipment and protective system intended for use in potentially explosive atmospheres, in compliance with standard EN IEC 60079-0:2018, EN IEC 60079-7:2015/A1:2018, EN 60079/31:2014.

The marking shall include the following:
II 3G Ex nA IIC T155°C (T3) Gc
II 3D Ex tc IIIC T135°C Dc

(A dedicated brochure is available)

STANDARDS AND REGULATIONS

Motors comply with the relevant standards and regulations as indicated in the table below:

ELECTRICAL	General stipulations for electrical machines	IEC 60034-1
	Terminal markings and direction of rotation of rotating electrical machines	IEC 60034-8
	Selection of energy-efficient motors including variable speed applications-application guide	IEC/TS 60034-31
	Thermal evaluation and classification of electrical insulation - Insulating materials	IEC 60085
MECHANICAL	Dimensions and output series for rotating electrical machines IM B3 shape	IEC 60072-1
	Dimensions and output series for rotating electrical machines IM B5 shape	IEC 60072
	Cylindrical shaft ends for electric motors	IEC 60072
	Classification of protection degree (IP code)	IEC 60034-5
	Methods of cooling	IEC 60034-6
	Mounting arrangements - IM code	IEC 60034-7
	Mechanical vibration - measurements evaluations and limits of vibrations	IEC 60034-14
	Tolerances	DIN 42948
	Tolerances of mounting and shaft extensions	DIN 42955
	Classifications of environmental conditions	IEC 60721-2-1
Mechanical vibration and shock (Balancing)	ISO 8821	

TOLERANCES

MECHANICAL TOLERANCES

Mechanical dimensions of electric motors are indicated in the regulation IEC 60072-1 that also sets out admissible tolerances, see the table below:

Values for	Tolerance	Tolerance compared to rated values
Diameter of the shaft end	from 8 up to 30 mm from 32 up to 48 mm from 55 up to 100 mm	j6 or k6 or h6 k6 m6
Feather key width	/	h9
Flange pilot	/	j6 or h7

Note: The threaded holes at the shaft ends conform to the regulation DIN 332-D

ELECTRICAL TOLERANCES

Values for	Tolerance compared to rated values
Stall current (measurement in S1 duty cycle at rated speed with $\vartheta_{amb} \leq 40$ °C and altitude ≤ 1000 m above sea level).	$I_0 \pm 5\%$
Rated current with rated torque and revolutions (measurement in S1 duty cycle at rated speed with $\vartheta_{amb} \leq 40$ °C and altitude ≤ 1000 m above sea level).	$I_n \pm 5\%$
Back electromotive force: B_{emf}	$B_{emf} \pm 5\%$

ϑ_{amb} = Ambient temperature

TOLERANCES

DERATING TABLES

The following derating tables with cumulative coefficients are provided for guidance. $K_{tot} = K_{temp} * K_{high} * K_{duty}$, according to different operating conditions, ambient temperature higher than 40 °C, altitude higher than 1000 m above sea level or duty cycles with overload.

Depending on application and ambient conditions, the temperature limit of the transducer could affect the motor performances. Drive parameter setting so as switching frequency lower than 10 kHz and bus voltage higher than 566 VDC could affect the motor performances.

DERATING ACCORDING TO ALTITUDE

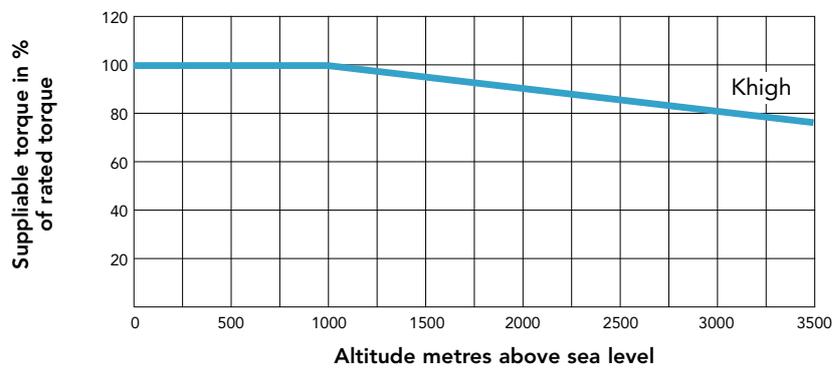

Fig. 1

DERATING ACCORDING TO AMBIENT TEMPERATURE

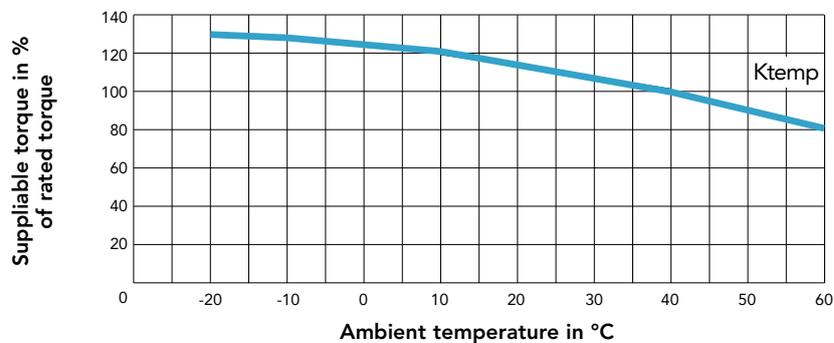

Fig. 2

SUPPLIABLE TORQUE ACCORDING TO A DUTY CYCLE

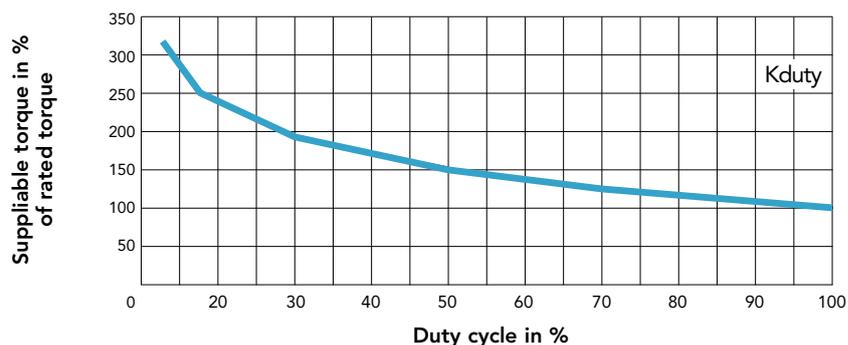

Fig. 3

SERVO SYSTEM

The **permanent magnet synchronous servomotor** along with the relative electronic drive, represents a servo system suitable for driving a shaft at high performance, particularly when dynamic control during transients or steady state stability is required. In general, they assure higher bandwidths than other motor types due to their compact design giving a high ratio of torque/inertia. They need no brushes, as their name suggests, unlike a DC motor. This gives high performance for limited dimensions, excellent reliability and reduced maintenance procedures.

Brushless servomotors are used in a wide range of operating fields, chosen for their ability to operate with an almost constant torque and withstanding overloads several times higher than rated current.

Servomotor performance is linked to the **electronic drive** that supplies them controlling stator phase switching thus substituting the commutator of the old DC machines. In the brushless servomotor currents are distributed to windings through power static switches (for example, IGBT, MOSFET) according to the position detected by means of an angular position transducer, such as resolver, encoder or Hall sensor. The power bridge along with the feedback element replaces the commutator of the old DC machines. The feature maintained in common with a DC motor is constant torque up to rated speed.

APPLICATIONS

- Numerical control shaft drive
- Intermittent motion controls
- Controls according to complex motion laws
- Machine tools for metals, wood and other material manufacturing (in general, chip forming machining)
- Textile machines
- Graphic and serigraphic machines
- Machines for ceramics industry
- Machines for packing industry
- Plastic moulding machines
- Winding and unwinding machines
- Vehicles supplied by batteries for material transport and movement
- Press supply
- Robotics and manipulation
- Transfer lines
- Paper factories

COMPONENTS

Three-phase synchronous permanent magnet servomotors are made up of the following main components:

Stator, with low-loss Fe-Si core lamination stack and three-phase star connection winding; insulation class F (for temperature rise of $\Delta T=105^{\circ}\text{K}$ and ambient temperature of $+40^{\circ}\text{C}$). Optionally available curus compliant insulation system.

Rotor, characterized by low-loss Fe-Si core lamination stack and peripheral surface with rare earth permanent magnets; the shaft is made of Ni-Cr steel; bearing have permanent lubrication.

Frame components, such as die-cast flange, endshield and cover, and extruded aluminium case.

Rotor position detector, whose adjustment responds to specific rules. Available in different types:

- Phase control and **monitoring** of motor revolution speed **with a Resolver**, (2-pole standard version, available with 4 and 6 poles) combinable with other feedback options.
- **Monitoring** of angular position and motor rotation speed **with an Encoder** combinable with other feedback options.

Note: it is also available with a sinusoidal encoder and a RS485 interface.

- AC (standard) brushless tachogenerator for monitoring motor rotation speed, equipped with three-phase winding (table "Tachometric transducer") combinable with other feedback options.
 - **Hall-effect sensors** with high thermal stability and high magnetic sensitivity: They allow monitoring of the rotor position for the correct piloting of the power bridge combinable with other feedback options.
-

Thermal sensor placed into stator winding in order to protect motor temperature. Different sensors type is also available on request.

Connections with the drive for both power and signals with connectors in all series.

Failsafe holding brake (optional) to be fitted in the flanged endshield, equipped with permanent magnets and electromagnetic release.

TECHNICAL DESCRIPTIONS

BRIEF DESCRIPTION

The following features of our standard motors may vary depending on series and type:

- Admissible environmental temperature: from -15 °C up to +40 °C, with altitudes 1000 m above sea level
- Mounting: IM B5 (V1 and V3 available)
- Flange concentricity degree "N"; balancing: vibration "N"; dynamic balancing with half key
- Shaft designed according to the standard version with key (also available without key)
- Available stall torque: from 0.18 Nm up to 390 Nm
- Available speeds: 300 to 6000 rpm
- Drive operating voltage: 400 Vac
- Pole number according to the series: 6, 8, 10 poles
- Insulation class: "F"; cooling through radiation and natural convection
- IP65 degree of protection for the whole range (IP67 optional); B28 is designed with IP65 protection as well except for the flange end
- On-Off PTO switch for thermal protection tripping at 140 °C (not included in B20Q), NTC and PTC are available
- Optional feedback by choice: resolver, encoder (several combinations may be added to this list)
- High acceleration and deceleration: up to 160.000 rad/sec²
- Reduced dimensions
- Rare earth permanent magnets
- Excellent distribution of the rotor magnetic field, in order to eliminate torque fluctuations at low speed.

DEFINITIONS

Stall torque (Mo): Torque available on the shaft continuously (service S1) with speed close to zero (lower than 200 rpm) and with a winding current equivalent to the stall current (see Figure 4).

Rated torque (Mn): Torque available on the shaft continuously (service S1) with rated speed and with a winding current equivalent to the rated current (see Figure 4).

Peak torque (Mpk): Torque available on the shaft discontinuously, with a winding current equivalent to the peak current (see Figure 4).

Stall current (Io): Current supplied to the motor continuously at a speed closed to zero, required to develop stall torque.

Rated current (In): Current supplied to the motor continuously at a rated speed, required to develop rated torque.

Peak current (Ipk): Current supplied to the motor discontinuously within a wide range of speed, required to develop peak torque (not to be exceeded to avoid magnet demagnetization).

TECHNICAL DESCRIPTIONS

Sinusoidal motor: The voltage waveform induced on motor phases by rotor rotation has a sinusoidal shape

Voltage constant (Ke): Ratio between voltage induced by the rotor rotation (RMS value for sinusoidal motor, peak value for trapezoidal motor) at a certain number of revolutions and angular speed ($\omega=2 \times \pi \times n/60$ where n is the speed expressed in rpm) measured in rad/sec. The induced phase to phase voltage at 1000 rpm is given by $V=K_e \times 1000 \times \pi/30$ Vrms

Torque constant (Kt): Ratio between torque on the shaft and the current RMS value for sinusoidal motors, peak value for trapezoidal motors (equivalent to the voltage constant of a trapezoidal motor and to that of a sinusoidal motor multiplied by $\sqrt{3}$).

Back electromotive force (B.E.M.F): Voltage induced by the rotor rotation (RMS value for sinusoidal motor, peak value for trapezoidal motor) at a certain number of revolutions.

Phasing procedure: Synchronization procedure of those signals generated by the transducer with the back electromotive force induced by the rotating rotor and measured between two phase terminals of the motor winding.

Saturation (saturation curve): It is made up of the peak torque curve combined with that representing the physical limit of the current, which may be expressed at some speed according to supply voltage (see Figure 4).

Duty cycle: In case of an intermittent duty cycle it is possible to overload the motor in proportion to the ratio between operating time and total cycle time: the figure shows two overload curves at 20% and 50% (S3 duty).

Torque to speed performance curve: continuous and intermittent duties.

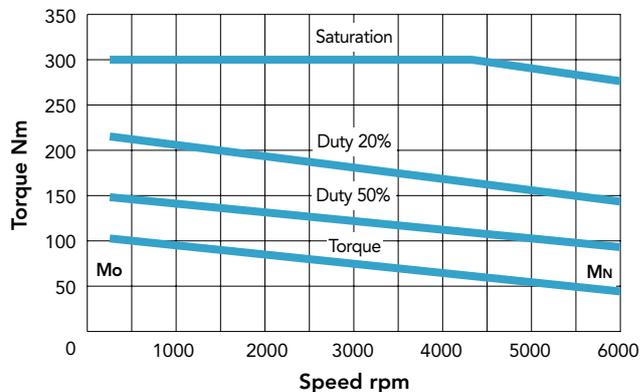

Fig. 4

Continuous duty area: It includes all points of the torque/speed figure where the load torque value is lower than or equivalent to the torque curve that joints Mo and Mn: therefore, this is a continuous operation duty. The continuous duty area is defined as the area below the torque curve in the motor speed range available (see Figure 4).

Intermittent duty area: It includes all points of the torque/speed figure where the load torque value is higher than the torque curve that joints Mo and Mn: therefore, this is non-continuous operation duty. The Intermittent duty area is defined as the area between the torque curve and the saturation curve (see Figure 4).

MOTOR IDENTIFICATION

In order to properly choose the motor, kinematic mechanism must be assessed, thus defining rated and stall torque, accelerations required through a speed torque graph compared with time, inertia of the machine (when a gearbox is coupled to the motor), and installation environment.

In order to make the choice of the motor easier, please refer to the Chapter "Order Data".

PHASING PROCEDURE

AUTOTUNING

In the event that the motor is equipped with a new generation digital drive you only need to carry out phasing procedures explained in the reference handbook, thus matching data indicated in the motor nameplate with related parameters.

STANDARD PHASING FOR MOTORS WITH RESOLVER

Example: 8 poles motor with 2 poles resolver

Disconnect terminals U, V, W from the drive.

Inject a direct current applying voltage with positive polarity in the Phase V and W (Blue and Red) and negative polarity in the phases U (Black): in this way the rotor of the motor results locked in a certain position. A current is required to hold the rotor in a fixed position, therefore without the presence of position clearance.

The resolver must be excited with an sinusoidal operating generator at 7Vrms - 10KHz or through a drive. Keeping, for instance, only electric supply Ecc+; Ecc- connected to the drive and leaving the other wires (Cos+, Sen+, Cos-, Sen-) free.

Display the signal Cos+ Sen+ using a two-channel oscilloscope by connecting each probe screen to the equipotential connections M0, including wires Cos-, Sen- and Ecc-.

Turn the stator of the resolver (always keeping the motor shaft hold) until the signal Cos+/M0 is null (<100mV) and the signal Sen+/M0 reaches the maximum value.

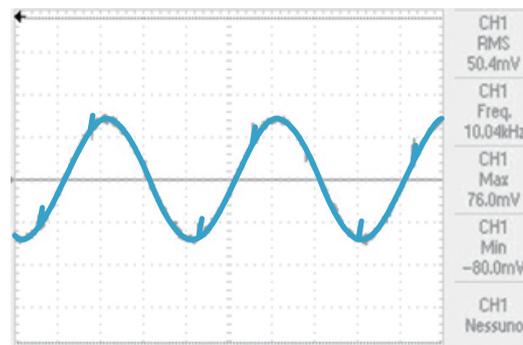

Fig. 5

In this position fix the stator of the resolver with the screws.

Turning the stator of resolver for 360 ° we'll find two positions (opposite) in which there is what is described above, both positions are correct.

With this feedback adjustment the motor end-shaft rotates in CW direction (looking the motor from the Drive-End/A-Side).

STANDARD PHASING FOR MOTORS WITH INCREMENTAL ENCODER

Disconnect terminals U, V, W from the drive.

The encoder must be excited with a power supply at 5V – 200mA or through a drive. Drag the motor with a test bench, making sure to turn it in a clockwise (looking at the flange end).

Display the "Motor signal SU" (generated between the motor phase U and V) using the channel 1 on the oscilloscope.

Display the "Encoder signal Hall U" using the channel 2 on the oscilloscope.

Turn the encoder until the signal "Hall U" appears in phase with the signal "SU", in this position fix the encoder with the screws (see picture).

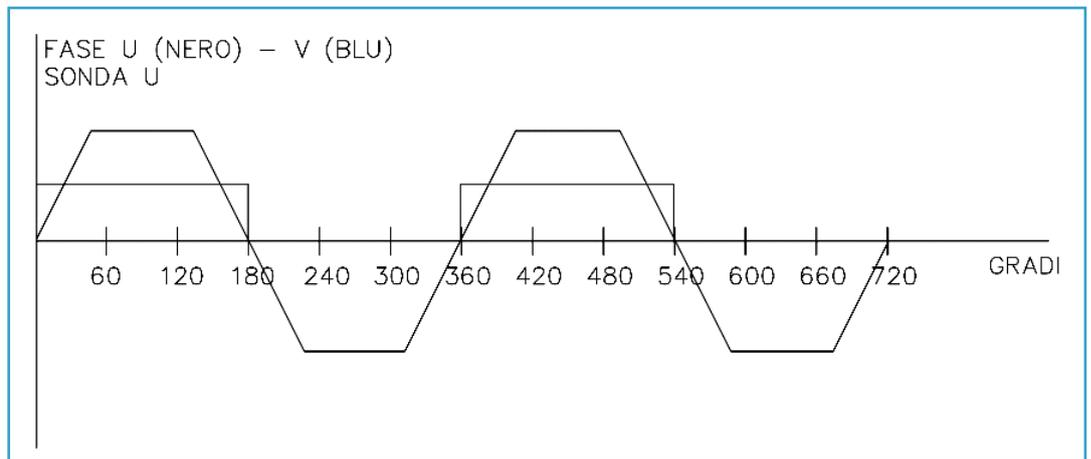

Fig. 6

Check the "Encoder signal Hall V" appears in phase with the "Motor signal SV" (generated between the motor phase V and W).

Check the "Encoder signal Hall W" appears in phase with the "Motor signal SW" (generated between the motor phase W and U).

STANDARD PHASING FOR MOTORS WITH ENCODER HIPERFACE AND DSL

Connect the signal connector by the Hyperface programmin Tool PGT-11-S, so the software recognizes the feedback mounted on the motor (See the picture => the picture valid only for example).

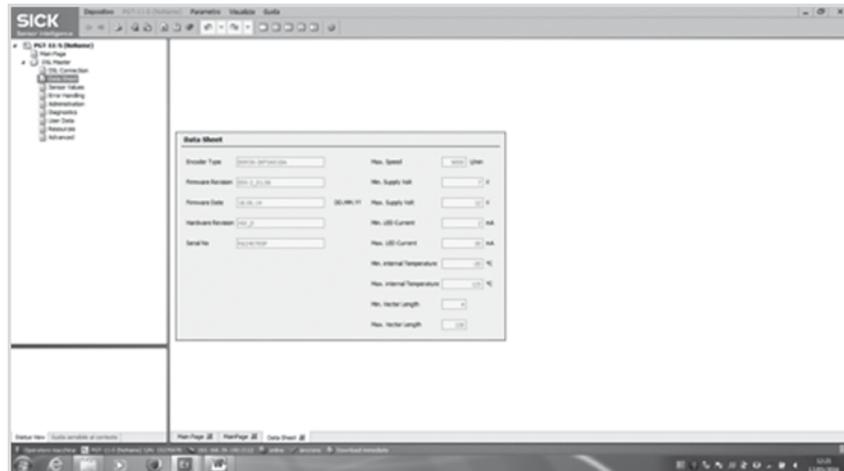

Fig. 7

Inject a direct current applying voltage with positive polarity in the Phase W (Red) and negative polarity in the Phases V (Blue): in this way the rotor of the motor results locked in a certain position. A current is required to hold the rotor in a fixed position, therefore without the presence of position clearance.

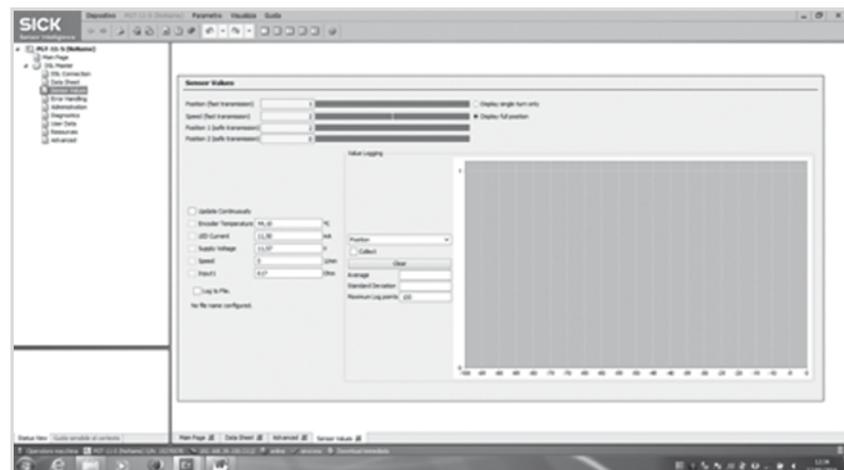

Fig. 8

In this position the encoder can be adjusted by the commutation angle = 0 ° The motor will be mechanically adjusted always on this position, so it should be possible to exchange one motor with another on the machine without further adjustments.

DEGREES OF PROTECTION

Degrees of mechanical protection for machines are designated in accordance with IEC 60034-5 by the letters IP and two characteristic numerals.

First numeral: Protection against contact and ingress of foreign bodies

Second numeral: Protection against ingress of water

IP	Description	IP	Description
0	No special protection	0	No special protection
1	Protection against solid foreign bodies larger than 50 mm (Example: inadvertent contact with the hand)	1	Protection against vertically falling water drops (condensation)
2	Protection against solid foreign bodies larger than 12 mm (Example: inadvertent contact with the fingers)	2	Protection against dropping water when inclined by up to 15°
3	Protection against solid foreign bodies larger than 2.5 mm (Example: Wires, tools)	3	Protection against waterspray at up to 60° from vertical
4	Protection against solid foreign bodies larger than 1 mm (Example: Wires, bands)	4	Protection against water splashed from any direction
5	Protection against dust (harmful deposits of dust)	5	Protection against water projected by a nozzle from any direction
6	Complete protection against dust. Is not described for electrical machines to IEC 34-5	6	Protection against heavy seas or water projected in powerful jets
		7	Protection when submerged between 0.15 and 1 m.
		8	Protection when continuously submerged in water at conditions agreed between the manufacturer and the user

Series is manufactured with degree of protection IP65 except for the A-side flange (fully IP65 design available on request). Series B36, B56, B63, B71, B100 are fully designed in accordance with degree of protection IP65. In addition, IP67 motors can be designed on request.

IP65 protection is designed for motor end shaft running not immersed in oil (to be evaluated the working condition if the pressure of the oil on the shaft is $\neq 0$). Specific design for motor end shaft immersed in oil is available on request.

BEARINGS

Specification of bearings (standard design).
Ball bearings in compliance with the regulation DIN 625.

FEEDBACK

As previously indicated, motors may be equipped with various transducer types in order to meet the different requirements for precision, cost and other parameters. The standard motor includes the use of resolvers. Encoders, tachos and Hall sensors are also available.

RESOLVER

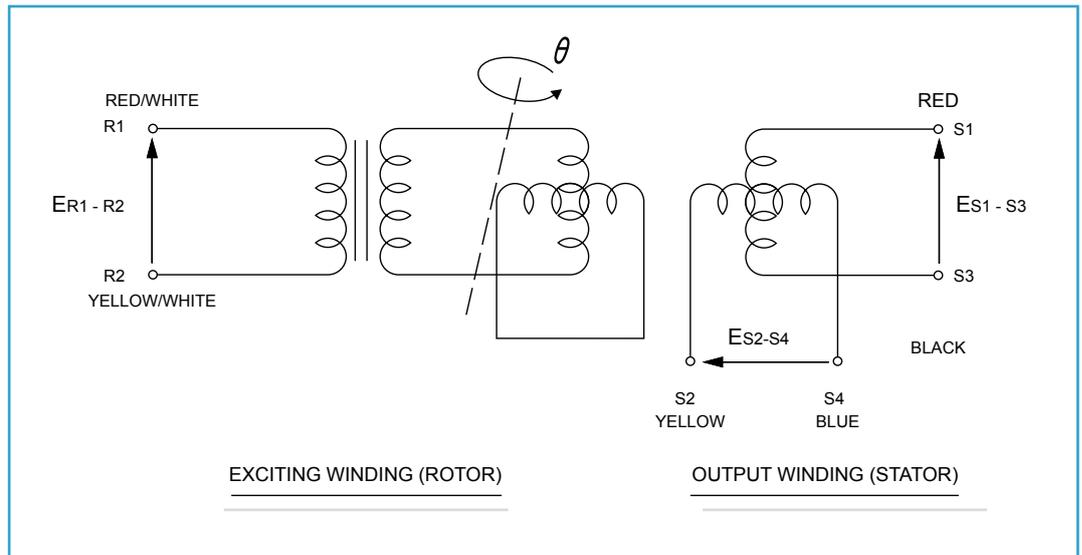

Resolver is a rotary transformer, which outputs AC voltage in accordance with angular position of the shaft. Resolver is excited by AC voltage to the rotor winding, and outputs from the stator windings sine and cosine voltages proportion to the rotation angle.

Drw. 2

Rated features	Assembled on the whole series	Units of measurement

ENCODER HIPERFACE SRS/SM50

Technical Data		
Encoder electronics		Hiperface
Code type for the absolute value		Binary
Number of sine/cosine periods per revolution		1024
Number of the absolute ascertainable revolutions	Single SRS Multi SRM	1 4096
Output frequency for sine/cosine signals		0...200 kHz
Max. operation speed		12000 min ⁻¹
Operating voltage range		7...12 V
Max. operating current, no load		80 mA
Interface signals	Process data channel = SIN, REFSIN, COS, REFCOS	Analogue, differential
	Parameter channel = RS 485	Digital
Working temperature range		-20° / +115° C

Tab.6

SIGNAL SPECIFICATION OF THE PROCESS DATA CHANNEL

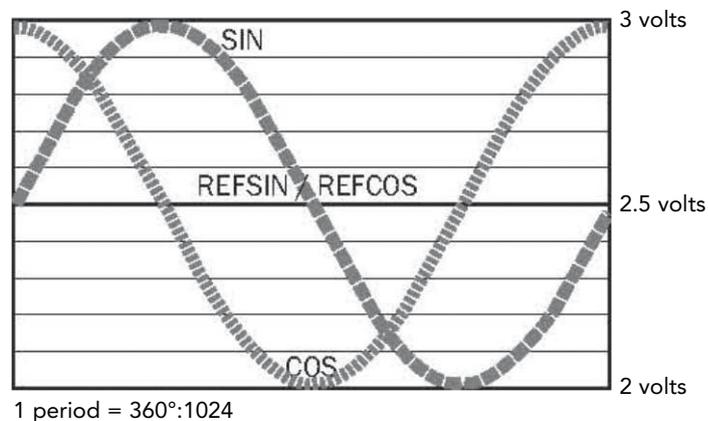

Fig. 9

Access to the process data used for speed control i.e. to the sine and cosine signals, is practically always "online". When the supply voltage is applied, the speed controller has access to this information at any time. Sophisticated technology guarantees stable amplitudes of the analogue signals across all specified environmental conditions, with a maximum variation of only ± 20 .

ENCODER HIPERFACE SEK/SEL37

Technical Data		
Encoder electronics		Hiperface
Code type for the absolute value		Binary
Number of sine/cosine periods per revolution		16
Number of the absolute ascertainable revolutions	Single SEK Multi SEL	1 4096
Output frequency for sine/cosine signals		0...200 kHz
Max. operation speed		12000 min ⁻¹
Operating voltage range		7...12 V
Max. operating current, no load		50 mA
Interface signals	Process data channel = SIN, REFSIN, COS, REFCOS	Analogue, differential
	Parameter channel = RS 485	Digital
Working temperature range	Single SEK	-40° / +115° C
	Multi SEL	-20° / +115° C

Tab.7

Number of absolutely encodable revolutions	1	4,096
Measuring step per revolution	262,144	262,144
Error limits positional values Integral non-linearity in angular seconds	± 80	± 80
Error limits positional values Differential non-linearity in angular seconds	± 40	
Max speed when switching on and resetting the motor feedback system	6000 min ⁻¹	
Available memory area	8,192 bytes	
INTERFACES		
Code type for the absolute value	Binary	
Code sequence	Increasing, when turning the shaft for clockwise rotation, looking in direction "A" (see dimensional drawing)	
Interface signals HIPERFACE DSL	Digital, RS485 1)	
Initialization time	Max 500 ms, on reaching a permissible operating voltage	
Measurement external temperature resistance	Output format: 32 bit value, without prefix Output unit: 1 Ω Measuring range: 0 – 209600 Ω Typical accuracy at -40°C - +160°C: NTC ±2K; PTC ±3K	
ELECTRICAL DATA		
Operating voltage range/supply voltage	7 – 12 V	
Warm-up time voltage ramp	Max 180 ms (duration of voltage ramp between 0 and 7.0 V)	
Operating current	Max 150 mA	
Output frequency for the digital position value	0 – 75 kHz	
AMBIENT CONDITION		
Working temperature range	-20°C - +115°C	
Storage temperature range	-40°C - +125°C	

Tab.9

THERMAL PROTECTION

All our motors are equipped with a single PTO switch, a thermal on-off detector that activates itself at a temperature of 140 °C (standard tolerance 5 °C). However a LPTC600 or a LPTC1000F may be used as an alternative.

PARKING BRAKE

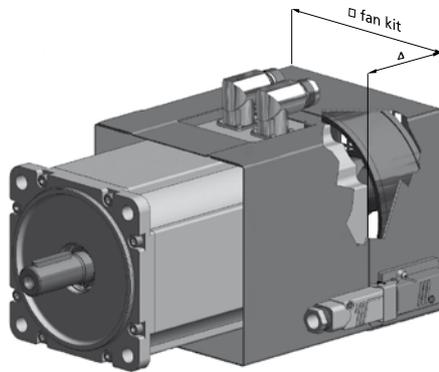

Motors with option "B" (in the alphanumeric code it is the 10th position as from the left: "A" and "D" no brake, "B" and "E" brake), are equipped with a parking brake with features depending on the series. See specific table for each motor type (see section Motor type codes used, pages 40-41).

FORCED VENTILATION

All standard motors are not ventilated; they are therefore cooled by conduction and convection through the surface (system IC410 or IC416).

In the series from B63 through B160, forced ventilation motors are also available. In this way it is possible to increase torque and current rated values by 30%. Length dimensions increase as well to accommodate the cooling fan (reference data is indicated in the table below). All fan have a degree of protection equal to IP20 (max IP54).

Fan characteristics depend on motor size according to table below:

Drv. 4

TOTAL MOTOR LENGTH WITH FAN KIT

Type	Voltage Volt	Power Consumption	Fan Kit square (mm)	Δ L (mm)
B63Q	24 Vdc	11 W	122 x 122	87
	230 Vac, 50/60 Hz	12 W		
B71Q	24 Vdc	12 W	164 x 164	98
	230 Vac, 50/60 Hz	47 W		
B100J	24 Vdc	12 W	212 x 212	110
	230 Vac, 50/60 Hz	47 W		
B132I	24 Vdc	12 W	246 x 246	116
	230 Vac, 50/60 Hz	47 W		
B160Q	24 Vdc	105W	295 x 295	175
	230 Vac, 50/60 Hz	136/185W		

* Motor length with encoder = motor length with resolver + Δ L

ORDER DATA

PRODUCT REQUEST: TO BE SUBMITTED FOR EVERY REQUEST WITHOUT MOTOR CODE

CUSTOMER NAME	Name
Enquiry date (initial request)	12/07/2019
Revision N°	00 dated 02/10/2019
Notes on the Enquiry	...
Target price [€]	...

QUANTITIES [pcs/year]	Value
Batch size [pcs/batch]	...
Motor sample [units]	...

APPLICATION DESCRIPTION		
Brief description of the application	...	
Typical ambient temperature [°C]	...	please specify if different from standard
Typical altitude [m]	...	please specify if different from standard
Heating sources close to the motor frame/flange (specify temperatures)	...	please specify if different
Axial load [N] - F_a	...	please specify if different
Radial load [N] - F_r	...	please specify if different
Additional - Axial / Radial loads (F_a/F_r diagrams)		please attach/describe the Load / Time diagram WHEN available
Present motor used: supplier and motor type	...	
Present drive used: supplier, size (Arms), phasing procedure	...	

DIMENSIONAL CONSTRAINTS, IF ANY		
Maximum motor diameter allowed [mm]	...	please specify if different from standard
Maximum motor length allowed [mm]	...	please specify if different from standard

STANDARD CONFIGURATION		
Please specify if different from below:		
Connectors 90° turnable	...	
IP65 (with oil seal); IP64 for B28Q	...	
Thermal sensor: PT0 140°C	...	

ORDER DATA

MOTOR TYPE - STANDARD RANGE	B56Q	(select from list, otherwise follow below)
DIMENSIONS (automatic filling in white)		
Square flange [mm] - SF	91,3	
Centring diameter [mm] - ØCD	Ø80j6	
Bolt circle diameter [mm] - ØBC	Ø100	
Bolt hole diameter [mm] - ØBH		
Shaft diameter [mm] - ØSD	Ø14	
Shaft length [mm] - ØSL	30	
End shaft type (smooth/keyed)	Smooth	(select from list) -NEEDED for production
Motor length according to Catalogue - L		
Specials, if any	...	
Brake (yes/no/special)	yes	(select from list)
For selected motor type above, holding torque is:	...	Nm (automatic filling)
Pls specify Holding brake if different from std motors	...	Nm
Motor cooling (self/air/water/flange/cooling)	Self cooling	(select from list)

MOTOR PERFORMANCE		
Rated Voltage [Vac]	...	
Standstill torque, M0 [Nm]	...	
Rated Torque, Mn [Nm]	...	
Rated speed [rpm]	...	
Peak torque, Mpk [Nm]	...	
Load cycle (Torque/time)	Attach / Describe diagram	
Speed cycle (Speed/time)	Attach / Describe diagram	

TRANSDUCER DEFINITION		
Resolver: specify n° of poles	...	
Encoder incremental single turn: specify n° of ppr	...	
Encoder incremental multi turn: specify n° of ppr	...	
Encoder absolute: specify n° of ppr	...	
Other specific transducer: attach mechanical drawing and pin-out if different from Lafert Standard	...	

SPECIAL REQUIREMENTS		
Please specify any special requirements, in addition to deviations to standard configuration, such as: Special rotor balancing grade, Special shaft material, Rotor inertia, Others	...	

MOTOR CODE		
Please use one sheet for each motor requested	...

* The value of inertia is approximate, because it is deeply depending on the type of coupling chosen by the customer.

** The value of stall and rated torque are approximate and depending on the type of coupling system chosen for the application.

TYPE B18P - 30 POLES

FOR MAINS VOLTAGE
400 V

The internal pages of this catalogue are made with Freelife Cento by Fedrigoni, the eco-friendly 100% recycled paper produced with recovered waste and low CO₂ emissions.

All technical data, outputs, dimensions and weights stated in this catalogue are subject to change without prior notice. The illustrations are not binding.

Printed in June 2021.

PRODUCT RANGE OVERVIEW

THREE-PHASE MOTORS

FIRST IN ENERGY SAVING

IE2 IE3 ENERGY C  **US**

BRAKE MOTORS

RELIABILITY FIRST

IE2 IE3 ENERGY C  **US**

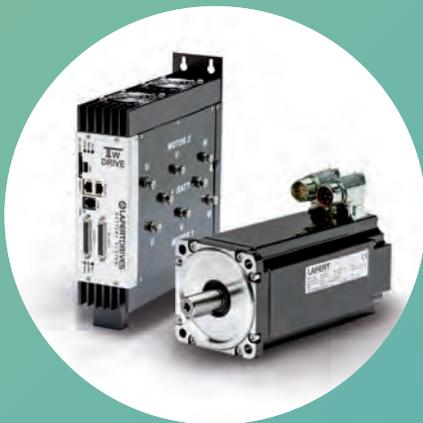

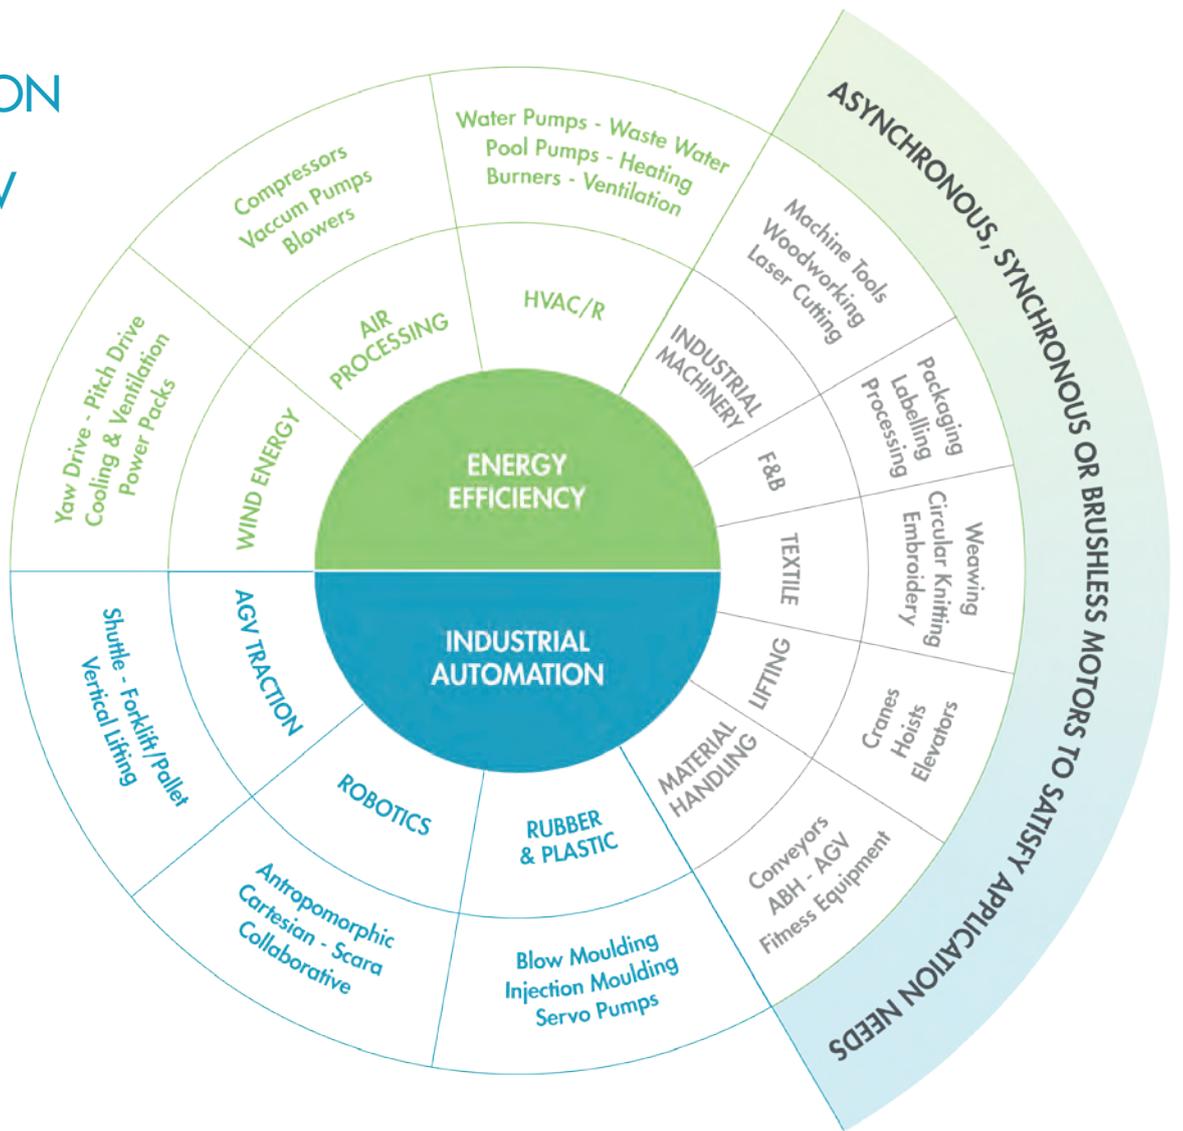

PM MOTORS & DRIVES

THE IE5 SOLUTION

IE4 IE5 ENERGY C  **US**

APPLICATION RANGE OVERVIEW

SERVO MOTORS & DRIVES
TOP PERFORMANCE,
REDUCED DIMENSIONS

SMARTRIS
PACKAGED-DRIVE SYSTEM
SOLUTIONS FOR AGV

LIFT RANGE
HIGHER & FASTER

Branches & Partners
